Development Progress Report

This week I polished up some more of the code but much of my progress was hindered while trying to set up github copolit. I saw the new agent implementation and decided to try it out and have it assist me in breaking out the inline style and script as modules of css and js. Unfortunately, setting up agentic coding and an MCP server took much longer than expected and even once it was set up, I had a lot of trouble getting the agent to break the code out. I'm sticking to doing this task on my own and by next week I should have a much better structure for the code as well as the oscillators, filter, and modulation set up.
